

GPX 6000 CABLE PROTECTOR

The Cable Protector clips onto the detector control box to help protect both the coil plug and control box socket from damage. Breaking a coil cable or even the control box plug can mean an expensive repair bill, this protector will help prevent that from happening.

INSTALLATION

- Clean the detector shaft of excess dirt before installing the Cable Protector
- Push the clip onto the detector shaft with the clip pushed all the way forward to the handle. This will allow room to plug the cable into the control box.
- Feed the cable up through the bottom of the protector and towards the plug.
- Screw the Coil Plug onto the Control Box.
- Slide the protector back over the control box socket nut, this will be tight by design to ensure that the protector is securely located over the socket.

Happy Prospecting 😊
